In Field oriented control, stator field is continuously updated based on the position of the rotor field. By continuously pulling the rotor to a new position, the rotor is always magnetized with a new vector, thus reducing torque ripple. Applications where low speeds are required take advantage of this property of FOC.

Speed sensorless field-oriented control of induction motor with rotor resistance adaptation. Abstract: Several field-oriented induction motor drive methods without rotational transducers have been proposed. These methods have a disadvantage that the rotor resistance variation causes an estimation error of the motor speed. Therefore, simultaneous estimation of the motor speed and the rotor resistance is required.

motor drive is a concern, the sensorless Field Oriented Control (FOC), also known as vector control, provides the best solution. The term "sensorless" does not represent the lack of sensors entirely, but the fact that in comparison with other driv es from the same category of field oriented control, it denotes that the speed

It models a sensorless field-oriented control (FOC) induction motor drive with a braking chopper for a 200HP AC motor. The motor speed is estimated from terminal voltages and currents based on the MRAS (Model Referencing Adaptive System) technique. Consequently, the speed sensor (necessary in AC3) is no more required.

Sensorless Field Oriented Control (FOC) of a Permanent ...
Vector control, also called field-oriented control, is a variable-frequency drive control method in which the stator currents of a three-phase AC electric motor are identified as two orthogonal components that can be visualized with a vector. One component defines the magnetic flux of the motor, the other the torque. The control system of the drive calculates the corresponding current component references from the flux and torque references given by the drive's speed control. Typically proportio

Field-oriented control allows us to obtain (almost) instantaneous (step) changes in torque on demand, and it does this by jumping directly from one steady-state condition to another. This simple statement is seldom given the prominence it deserves, but it is a simple truth, to be recalled whenever there is a danger of being bamboozled by a surfeit of technospeak.
